

Canteen Food Ordering App - Design Document

1. User Research

Target Users: College students, age 18-22

Problem Statement: Students face long queues in canteen during 15-minute breaks. They waste 10-12 minutes waiting in line, which causes them to miss classes or skip meals. There is a need for a faster ordering system.

2. User Persona

Name: Ghariya Jaymendrasinh

Age: 19 Years

Occupation: Btech IT 2nd Year Student

Goals: Order food quickly from classroom, avoid waiting in long queues, collect food on time during short breaks.

Pain Points: Long queues waste break time, risk of being late to lectures, sometimes skips food due to rush.

3. User Flow

Step 1: Login with mobile number

Step 2: Browse food categories on Home screen

Step 3: Select food item and view details on Menu screen

Step 4: Add items to Cart and complete payment

Step 5: Receive Token Number and collect food from counter

4. Design Thinking Process

Created low-fidelity wireframes in Figma focusing on core functionality rather than visual design. Used [1] [2] annotation system to highlight key features like search bar, add-to-cart button, and token generation. This documents the purpose of each UI element and shows the user journey from login to food collection.
